

# Wireless LTE Failover

## How it works

Rather than paying full price for a data plan you may rarely use, we offer a ZERO USAGE plan at a fraction of the cost of other providers plans. That's a significant reduction in business expense.

If you experience a failure with your primary internet connection, our managed router automatically recognizes the failure and switches the connection to the AT&T / Verizon LTE Wireless network. This keeps your revenue flowing and employees productive! Although the fail over is completely seamless, you and SingleSource IT will be notified of the failure and switchover. During this period, SingleSource IT has a real-time view of the data consumption, and the router will automatically switch the connection back when the primary connection is up and running.

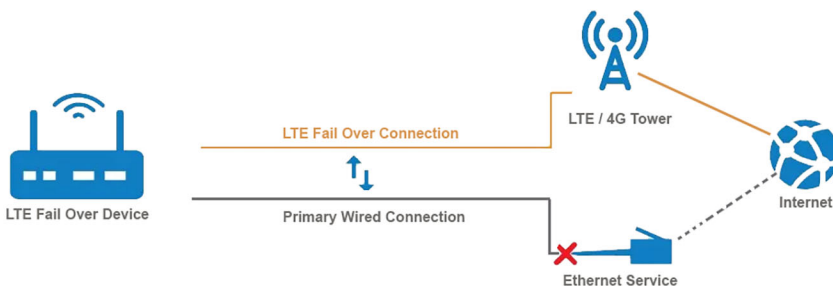

You only pay for the data you consume during failover. There are no overage charges. You simply pay the preset plan price for your level of consumption for that month. The next month, you return to your low-cost, ZERO USAGE PLAN. We eliminate wasted expense and you will NEVER over pay.

### Key Features

- LTE Certified embedded cellular modem
- Compact size
- M2M solution
- Branch office or retail solution
- Optimal signal strength placement
- Enterprise ready
- Static Public IP Available

### Benefits

- Connects any Ethernet device to cellular network
- LTE Certified embedded cellular modem
- Neutral color and included mounting hardware ideal for branch office and retail locations

**\$9.95** per month + usage
